DETAILED ACTION

Priority

1. Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

Claim Objections

2. Claims 1 and 4 are objected to because of the following informalities: "ration" in line 5 of claim 1 should read --ratio--.. Appropriate correction is required.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1-6 are rejected under 35 U.S.C. 102(b) as being anticipated by Li (US5942466 to Li et al.).

Li discloses subjecting a raw material powder comprising Bi, Pb, Sr, Ca, Cu, and O having a composition ratio of (Bi+Pb):Sr:Ca:Cu of approximately 2:2:2:3 (see Example 1, the ratio is 2:1.9:2:3). In the example, the powder is heat-treated at 780 degrees C at an oxygen partial pressure of 0.001 atm. This forms substantially the orthorhombic 2212 superconducting phase (i.e. ratio (Bi+Pb):Sr:Ca:Cu is approximately 2:2:1:2), with no discernible plumbate (i.e. non-superconducting phase containing lead). The powder is then used in an OPIT process (i.e. oxide powder-in-tube), thus undergoing plastic working and heat treatment (see cols. 1 and 2 for more information

about the OPIT process) to form superconducting wires (see especially col. 1, Ins. 30-51). Although Example 1 shows the heat treatment at 780 degrees, Li discloses performing this process between 650 and 795 degrees, at an oxygen partial pressure of between 10^{-5} atm and 0.04 atm (see col. 10, Ins. 20-31).
